

## Understanding sustainable development and achieving sustainable cities

Maryam Hajilou Master of Science in Islamic Azad University of Khomein

### Extract:

With regard to issues such as energy conservation, natural manifestations (because environmental problems are one of the most important problems in human life), saving time and money, a major issue in current societies, accelerating the move towards environmental protection, Economic development and social progress. Therefore, the benefits of sustainable development and the fruits of it are needed more than ever, because sustainable development has a direct relationship with the welfare of people in urban areas and covers all aspects of urban life, such as political, physical, and other. Therefore, it is a good solution for the natural use of natural resources, along with the use of standardized methods for environmentally friendly design, which results in a sustainable city with a beautiful view of the present. However, for the full realization of these goals, identifying the needs of community members, national and international research, along with educational efforts and the adoption of precise planning frameworks are needed. In addition to the above mentioned issues, the most important challenges facing sustainable development, the economic constraints of the middle classes of society, poor planning and management, lack of attention to indigenous knowledge and others, as detailed in the article, will be referred to them, is. Therefore, in terms of environmental, architectural, economic, etc, it is necessary to consider this area more closely. The research method is descriptive-analytic. The method of collecting data through library books, documents and documents, along with the evaluation and evaluation of their various aspects. In this regard, in this research, we first discuss the research background, goals, dimensions of sustainable development and other issues. The effort in this article is to present materials that could be useful steps to promote sustainable development and sustainable city by taking advantage of factors affecting them such as culture, architecture, etc, along with preserving the environment and creating a beautiful landscape. In this research, these factors are among the main issues in increasing the use of sustainable development in cities, communities and reducing the adverse effects on the environment. Finally, in this research, the result is expressed in order to better and better benefit from the subject matter studied.

### Introduction:

The need for a sustainable city that can provide welfare services, diverse ecological and technological qualities to its inhabitants, by expanding cities and creating many and varied problems in this area (such as population growth, distance from nature, social and economic problems) is felt more and more. In line with this, the principles of sustainable development are in line with the concept of sustainability. Sustainable development provides solutions to problems such as environmental degradation and ecosystems, increased pollution, and so on. The theory of sustainable development and, consequently, sustainable architecture is one of the most important themes of contemporary architecture. But it has not fully realized. Sustainable development can empower environments in terms of urban visions and landscapes, thus giving the citizen a positive effect. In this article, after the introduction of sustainable development, a background statement of the subject, about goals, dimensions, its relation with culture, education, architecture, environment and others have been discussed. At the end of the article,
