Abstract

The Internet serves as an ideal way for information and advertising. The widespread use of the Internet throughout the world and the public's use of this complex phenomenon creates challenges for users, whose neglect can cause irreparable damage not only at the urban and national levels but also globally and internationally to governments and all public institutions. Import One of the negative aspects of Internet growth in today's technology is the rise and growth of the phenomenon called Dark Web, which unfortunately has been struggling to ruin ethics and psychological morale in the international community.

Keywords: Security on the Internet, Dark Web, Flame Malware, Crawler.
