ABSTRACT

Nowadays, software and three-dimensional (3D) modeling play a vital role in architecture. It can be truly stated that sketch is the first and fastest way to express opinions and ideas for design; however, the final output of any idea and concept in current world should be presented as a three-dimensional output in order to reveal more details and effect on audience because of its visual beauty. In our dear country, Iran, all of employers, referees, architects, academic professors, etc. except nothing form final output unless a beautiful and high-quality 3D. On the other hand, graduated architects should be able to work with architectural 3D software if they want to be employed in private and governmental design companies.

This study was conducted to introduce a new method for 3D architectural design for the first time using applied-developmental method, a method that provides the most suitable output within short time merging simple and understandable commands of four programs (software). The final output of this method was confirmed by employers of architecture in terms of occupation, also by referees of architecture competitions and academic professors in terms of education.
